

Assignment 10 – Selenium Python Behave BDD Framework

1. Module Name

Python BDD Restful Automations

2. Experiment Title

Scenario 1: Implementation of Selenium Python and Behave BDD Framework

3. Problem Statement

Implement a behavior-driven Selenium automation framework in Python using Behave and execute a readable Given/When/Then login scenario.

4. Objective

Set up Selenium WebDriver with Behave BDD, create a Gherkin feature, implement Python step definitions, execute the scenario, and verify successful navigation after login.

5. Tools, Software and Concepts Used

Python; Selenium WebDriver; Behave BDD; Google Chrome; Gherkin; Given/When/Then; browser setup and teardown.

6. Source Code / Implementation Steps

Installed Selenium and Behave. Created environment.py for browser setup and teardown. Created login.feature for the BDD scenario. Implemented Python step definitions for opening the page, entering credentials, clicking Login, and validating the inventory URL. Added pauses for screenshot capture and executed the scenario with Behave.

7. Output / Labelled Screenshots

Screenshot 1 – Login Page. Screenshot 2 – Inventory Page. Screenshot 3 – Behave Execution in the terminal. Screenshots are stored in Source_Code/Screenshots.

8. Result

The Selenium Python Behave BDD framework was implemented successfully. The scenario validates a successful SauceDemo login and inventory-page navigation.

9. Observation

Behave separates business-readable scenarios from Python implementations. This improves readability and provides a structured basis for expanding the automation suite.

10. Conclusion

The experiment successfully demonstrated Selenium Python automation integrated with the Behave BDD framework.
