

# Assignment 13 – Robot Framework Basic Syntax and Keywords

## 1. Module Name

Robot Framework

## 2. Experiment Title

Assignment 1: Basic Syntax and Keywords

## 3. Problem Statement

Create a Robot Framework automation test case that opens a web browser, navigates to a specified URL, enters data into web form fields, performs a login action, and verifies the presence of a specific web element.

## 4. Objective

Understand Robot Framework basic syntax and execute a SeleniumLibrary-based test using variables, keywords, browser navigation, input actions, and element verification.

## 5. Tools, Software and Concepts Used

Python; Robot Framework; SeleniumLibrary; Selenium WebDriver; Google Chrome; Robot Framework Settings, Variables and Test Cases sections; Input Text; Click Button; Page Should Contain Element; Wait Until Page Contains Element.

## 6. Source Code / Implementation Steps

Configured SeleniumLibrary in the Settings section and added suite teardown. Defined reusable variables for URL, browser and login credentials. Created a test case that opens SauceDemo, maximizes the browser, verifies the username field, enters username and password, clicks Login, waits for the inventory element and verifies the Products page content.

## 7. Output / Labelled Screenshots

Screenshot 1 – Robot Framework Execution: terminal output showing the completed test with the final pass status. The screenshot is stored in Source\_Code/Screenshots.

## 8. Result

The Robot Framework test case was implemented successfully using SeleniumLibrary. Browser navigation, form input, button interaction and element verification were completed as required.

## 9. Observation

Robot Framework uses readable keyword-driven syntax. Variables improve maintainability, while SeleniumLibrary provides browser automation keywords without requiring lengthy Selenium API code.

## 10. Conclusion

The experiment successfully demonstrated Robot Framework basic syntax and commonly used SeleniumLibrary keywords for web automation.
